

AMENDMENTS

In the Claims:

Please amend the claims as indicated hereafter.

1. (Original) An anomaly detection system, comprising:

an echo canceler having a plurality of taps respectively associated with a plurality of tap coefficients; and

anomaly detection logic configured to determine a difference between a new tap coefficient associated with one of the taps and a previous tap coefficient associated with the one tap, the anomaly detection logic configured to perform a comparison between the difference and a threshold and to detect an anomaly along a telecommunication line based on the comparison.

2. (Original) The system of claim 1, wherein the anomaly detection logic is configured to maintain a histogram of anomaly indications based on comparisons of associated tap coefficients.

3. (Original) The system of claim 1, wherein the anomaly detection logic is configured to maintain a running sum of a total number of anomaly indications detected by the anomaly detection logic based on comparisons between tap coefficients associated with the one tap.

4. (Original) The system of claim 3, wherein the anomaly detection logic is configured to compare the running sum to a threshold.

5. (Original) The system of claim 1, wherein the anomaly detection logic is configured to perform a second comparison between a threshold and a value indicative of an error rate associated with the telecommunication line, the anomaly detection logic further configured to detect the anomaly based on the second comparison.

6. (Original) The system of claim 5, wherein the value represents a minimum signal-to-noise ratio detected during a particular time period prior to the second comparison.

7. (Original) An anomaly detection system, comprising:
an echo canceler having a plurality of taps respectively associated with a plurality of tap coefficients; and
anomaly detection logic configured to determine when at least one of the tap coefficients fluctuates by at least a specified amount and to detect an anomaly along a telecommunication line based on a detection, by the logic, that the at least one tap coefficient fluctuated by at least the specified amount.

8. (Original) The system of claim 7, wherein the anomaly detection logic is further configured to maintain a running sum indicative of a number of times that the logic detects the at least one tap fluctuating by at least the specified amount, wherein the anomaly detection logic is configured to detect the anomaly based on the running sum.

9. (Original) The system of claim 8, wherein the anomaly detection logic is further configured to compare the running sum to a threshold.

10. (Previously Presented) An anomaly detection system, comprising:
an echo canceler having a plurality of taps respectively associated with a plurality of tap
coefficients; and
anomaly detection logic configured to establish a set of baseline tap coefficients based on
the tap coefficients, the anomaly detection logic configured to compute differences between new
tap coefficients of the echo canceler and the baseline tap coefficients and to detect, based on the
differences, a time varying anomaly along a telecommunication line at a junction of two sections of
the telecommunication line.
11. (Original) The system of claim 10, wherein the anomaly detection logic is configured
to periodically update the baseline tap coefficients.
12. (Original) The system of claim 10, wherein the anomaly detection logic is configured
to perform comparisons between the differences and a plurality of thresholds, each of the
comparisons comparing a respective one of the differences and a respective one of the
thresholds, wherein the anomaly detection logic is configured to detect the anomaly based on the
comparisons.
13. (Original) The system of claim 12, wherein the anomaly detection logic is configured
to update at least one of the baseline tap coefficients in response to one of the comparisons.
14. (Original) The system of claim 12, wherein the anomaly detection logic is configured
to maintain a histogram of the results of the comparisons.

15. (Previously Presented) An anomaly detection method, comprising the steps of:
 - determining a difference between a new tap coefficient associated with a tap of an echo canceler and a previous tap coefficient associated with the tap;
 - comparing the difference to a threshold; and
 - detecting an anomaly along a telecommunication line based on the comparing step, the anomaly causing a time varying change in a transmission characteristic of a point along the transmission line.
16. (Previously Presented) An anomaly detection method, comprising the steps of:
 - monitoring a plurality of tap coefficients of an echo canceler;
 - determining when at least one of the tap coefficients fluctuates by at least a specified amount; and
 - detecting an anomaly along a telecommunication line based on the determining step, the anomaly causing a time varying change in resistance at a point along the transmission line.
17. (Original) The method of claim 16, further comprising the step of maintaining a running sum indicating a number of times that the at least one tap coefficient fluctuates by at least the specified amount, wherein the detecting is further based on the running sum.
18. (Original) The method of claim 17, wherein the detecting step comprises the step of comparing the running sum to a threshold.

19. (Previously Presented) An anomaly detection method, comprising the steps of:
establishing a set of baseline tap coefficients based on a set of tap coefficients of an echo
canceler;
computing differences between the baseline tap coefficients and new tap coefficients of
the echo canceler; and
detecting an anomaly along a telecommunication line based on the differences, the
anomaly causing a time varying change in resistance at a junction of two sections of the
telecommunication line.

20. (Original) The method of claim 19, further comprising the step of periodically updating
the baseline tap coefficients.

21. (Original) The method of claim 19, further comprising the step of comparing the
differences to a plurality of thresholds, wherein the detecting step is further based on the
comparing step.

22. (Previously Presented) An anomaly detection method, comprising the steps of:
establishing a set of baseline tap coefficients based on a set of tap coefficients of an echo
canceler;
computing differences between the baseline tap coefficients and new tap coefficients of
the echo canceler;
detecting an anomaly along a telecommunication line based on the differences;
comparing the differences to a plurality of thresholds, wherein the detecting step is further
based on the comparing step; and

updating at least one of the baseline tap coefficients in response to a comparison between one of the differences and one of the thresholds.

23. (Original) The method of claim 21, further comprising the step of maintaining a histogram of the results of the comparing step, wherein said detecting step is further based on the histogram.

24. (Previously Presented) The system of claim 1, wherein the anomaly is a degraded splice along the telecommunication line.

25. (Previously Presented) The system of claim 1, wherein the anomaly causes a resistance at a point on the telecommunication line to vary over time.

26. (Previously Presented) The system of claim 1, wherein the new tap coefficient is based on a first digital signal transmitted from a transmitter at one end of the telecommunication line to a receiver at another end of the telecommunication line, and wherein the previous tap coefficient is based on a second digital signal transmitted from the transmitter to the receiver.

27. (Previously Presented) The system of claim 1, wherein the anomaly detection logic is configured to indicate, based on the comparison, a location of the anomaly on the telecommunication line.

28. (Previously Presented) The system of claim 7, wherein the anomaly is a telecommunication line splice that is degrading communication occurring over the telecommunication line between a transmitter at one end of the telecommunication line and a receiver at another end of the telecommunication line.

29. (Previously Presented) The system of claim 28, wherein the detection is based on a fluctuation of the tap coefficient while the transmitter is communicating with the receiver over the telecommunication line.

30. (Previously Presented) The system of claim 29, wherein the anomaly detection logic is configured to indicate, based on the detection, a location of the splice on the telecommunication line.

31. (Previously Presented) A system, comprising:
a receiver coupled to a telecommunication line, the receiver configured to receive digital signals transmitted from a remote transmitter via the telecommunication line, the telecommunication line having a time varying anomaly causing a resistance at a point on the telecommunication line to fluctuate over time thereby degrading the digital signals; and
anomaly detection logic configured to detect the anomaly and to provide an indication of a location of the anomaly.

32. (Previously Presented) The system of claim 31, wherein the anomaly detection logic is configured to detect the anomaly based on coefficients of an echo canceler.

33. (Previously Presented) The system of claim 31, further comprising an echo canceler having a plurality of taps respectively associated with a plurality of tap coefficients, wherein the anomaly detection logic is configured to perform a comparison of a first tap coefficient associated with one of the taps and a second tap coefficient associated with the one tap, the anomaly detection logic further configured to detect the anomaly based on the comparison.
